ANGULAR PROJECT REPORT

INTRODUCTION

Employers could gain insight into their employees via an employee management system. which allows them to better plan and manage work hours, lowering labor expenses and increasing productivity.

Modules

1.Employee details: this module contains the details of the employee such as

- 1.employee id,
- 2.employee name,
- 3.date of joining
- 4.current department

2.department details:this module contains all the details of the department
Such as

- 1.department id
- 2.department name

Languages used

- 1.HTML
- 2.CSS
- 3.Typescript
- 4.c#

framework used

Angular is a UI component library that provides pre-built UI components and styles for Angular applications. It offers a set of reusable components such as forms, buttons, tables, and modals, which can be easily integrated into the application.

IDE and code editor used

- 1.visual studio code
- 2.visual studio

Purpose of employee management system

Employee Management System Project is essential software designed to keep track of employee information in anyIt stores data such as their employees' personal information.the goal of the "Employee Management System" is to create a work center scheduling system. Scheduling is a technology that makes the process of informing activities and notifications in the company where it is implemented simply and even online.

Features of employee management

Features of Employee Management System offers the following:

1.create

This feature allows the user to add new employee details in the existing database.

2.delete

This feature allows the user delete employee details Which is already existing in the database.

3.update

This feature allows the user to modify or update employee Details which is present in the database

4.search

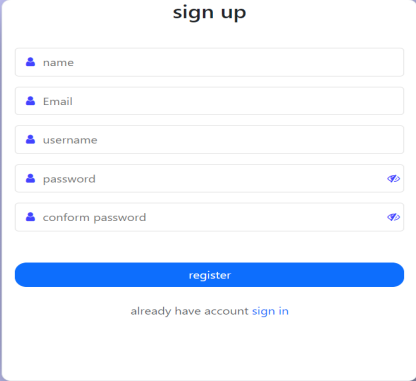

The user can use the search option to view the specific details of an employee.

User login and signup

The user signup page allows the user to register by filling in the details of the employee. After the registration process is successfully completed the user is directed to the user login page where he fills the username and password given in the registration process.

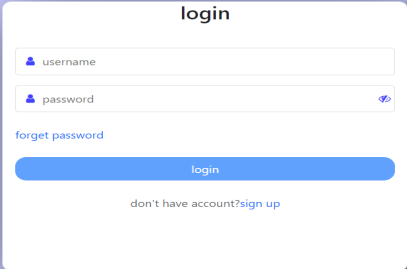

Images for reference

Sign up

A sign up form titled "sign up" is displayed on a light purple background. The form contains five input fields: "name", "Email", "username", "password", and "conform password". Each field has a small blue user icon to its left. The "password" and "conform password" fields have a blue eye icon to their right, indicating a toggle for password visibility. Below the input fields is a blue "register" button. At the bottom of the form, there is a link that says "already have account sign in".

Sign in

A sign in form titled "login" is displayed on a light purple background. The form contains two input fields: "username" and "password". Each field has a small blue user icon to its left. The "password" field has a blue eye icon to its right, indicating a toggle for password visibility. Below the input fields is a blue "login" button. Above the "login" button, there is a link that says "forget password". At the bottom of the form, there is a link that says "don't have account? sign up".

User Authentication:

The system includes user authentication to ensure data security and restrict access to invalid users. Only authorized personnel can perform administrative tasks,

Working of project:

Visual studio code is used to develop UI part of the project
HTML,CSS,TS codes are written here.all the services and
Components are present here.

T.S-TypeScript is a syntactic superset of JavaScript which adds static typing. This basically means that TypeScript adds syntax on top of javaScript.

Launch json-A launch.json file is used to configure the debugger in Visual Studio Code. Visual Studio Code generates a launch.json (under a .vscode folder in your project) with almost all of the required information

Shared services-An Angular shared service is a powerful tool to allow cross component communication

HTML and CSS- HTML and CSS are used to develop the web page and to add design.

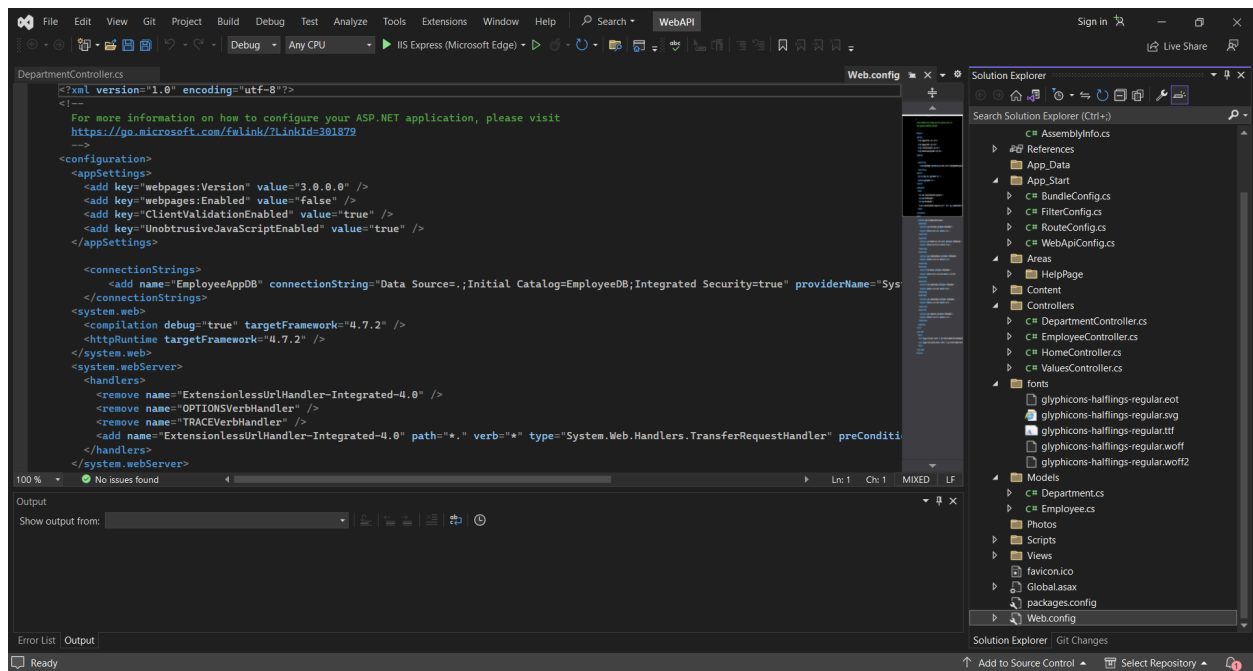

Visual studio acts as an API part of the project which help to connect the project with the database so as to perform the CRUD function.c# and sql commands are present here for the process.

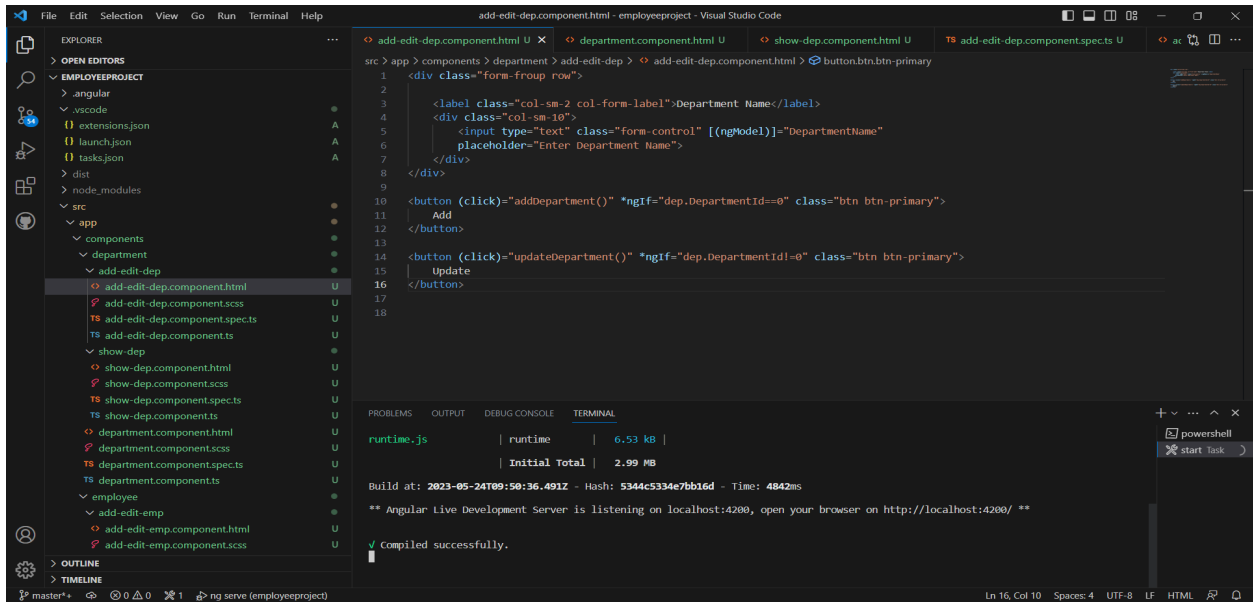

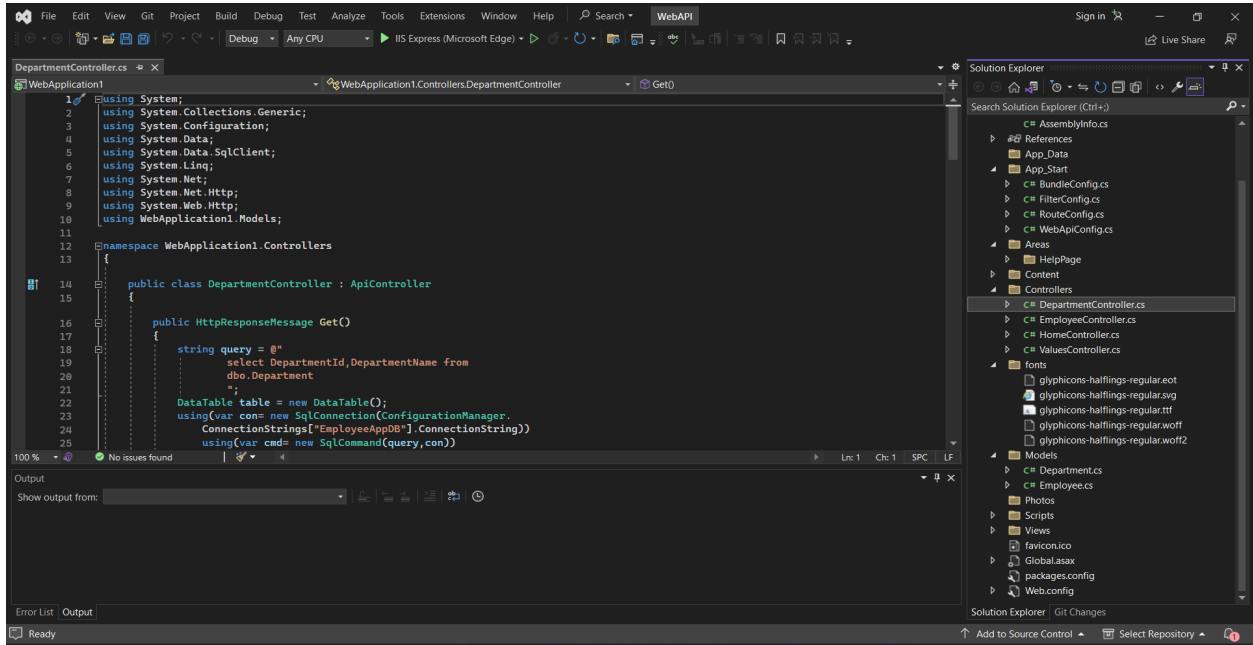

controllers-Controller class contains public methods called Action methods. Controller and its action method handles incoming browser requests, retrieves necessary model data and returns appropriate responses.

Models - A model can help you visualize the world in which your system works, clarify users' needs, define the architecture of your system, analyze the code, and ensure that your code meets the requirements.

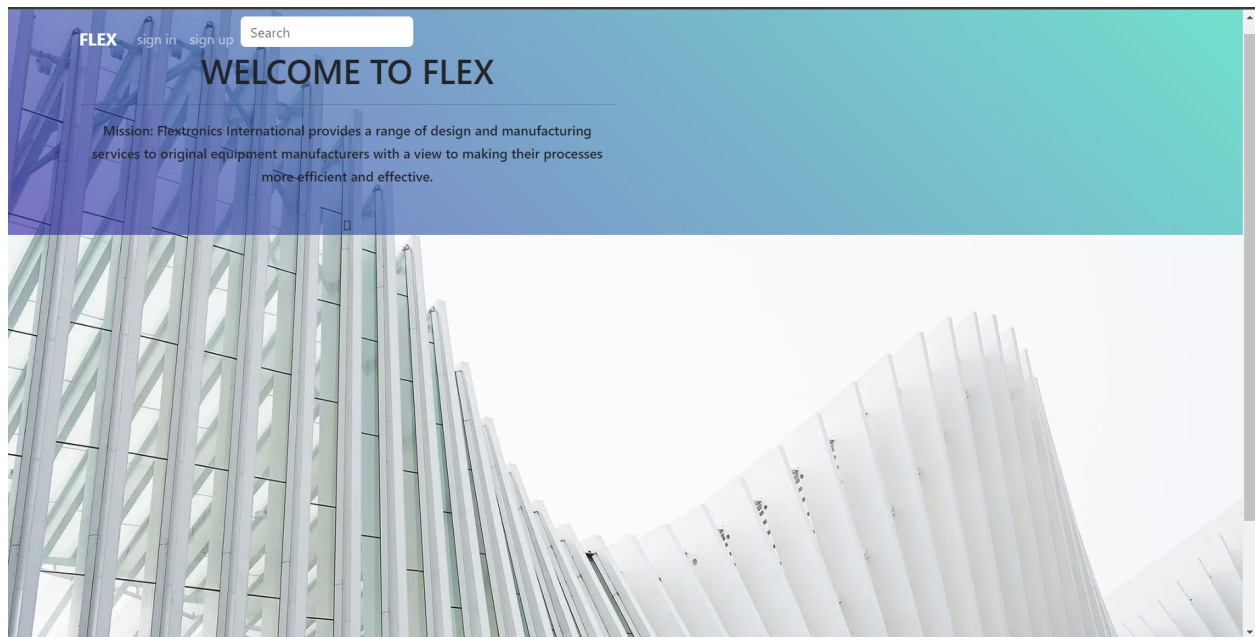

Webconfiguration-The web.config file is required at the root of the app to enable the publishing of multiple apps using WebDeploy.

Conclusion

The Employee Management System is a user-friendly application and easy to use. Also, it maintains all of the details of the employees and helps in improving the entire business performance.
